(54) Fluorine-containing compounds.

A fluorine-containing compound represented by the general formula [I]:

$$R_{1} \leftarrow W)_{Q} > z - R_{4} - COOH$$

$$R_{f} \leftarrow X \rightarrow_{m} R_{2} \leftarrow Y \rightarrow_{n} R_{3}$$
[1]

wherein R_f is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, R_2 is an aliphatic alkylene group or an aliphatic polyalkylene oxide group which have no or one or more carbon atoms, each of R_3 and R_4 is an aliphatic alkylene group having no or one or more carbon atoms, X is a connecting group selected from the group consisting of

-COORs - and -CON(R6)-

(wherein R₅ is an aliphatic alkylene group having no or one or more carbon atoms, and R₆ is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), each of W and Y is connecting group selected from the group consisting of

-S-, -COO- and -SCH2CH(R7)COO-

P 0 473 871 A2

(wherein R_7 is a hydrogen atom or a methyl group), Z is a connecting group selected from the group consisting of

$$-CH-$$
, $-N-$ and $-N-$,

and each of ℓ , m and n is zero or 1. There are disclosed a fluorine-containing compound of a specific structure which has in the molecule a fluoroalkyl ether end group, an aliphatic hydrocarbon end group and a carboxyl end group, and has a molecular weight of hundreds to about 3,000; and a process for producing the fluorine-containing compound. This fluorine-containing compound can be utilized in magnetic recording media in the form of a lubricant composition.

BACKGROUND OF THE INVENTION

Field of the Invention

The present invention relates to a novel fluorine-containing compound useful as a lubricant for precision machines and precision parts which require high-precision lubrication, or as a surfactant, a mold-release agent, a rust preventive, etc.; a process for producing the fluorine-containing compound; a lubricant composition comprising the fluorine-containing compound; and a magnetic recording medium such as a magnetic tape, a magnetic dis, etc., the lubricant layer of which comprises the fluorine-containing compound. Description of the Prior Art

With miniaturization and an increase in precision of machines and parts thereof, the mode of lubrication in their sliding portions has come to be changed from hydrodynamic lubrication to boundary lubrication. Particularly in electronic machines and electronic parts, for example, VTR and magnetic discs high-precision lubrication has become necessary for sliding a magnetic tape or a magnetic disc on a magnetic head, because of employment of thin ferromagnetic metal films for improving the packing density. For example, in metallized tapes and hard discs, a lubricant layer on the surface of a magnetic layer is formed to a thickness of only several tens angstromes to increase the output by reducing the loss due to the spacing between a magnetic recording medium and a magnetic head as much as possible while assuring the durability and the practical reliability. Therefore, it is an important problem to develop an organic compound having an excellent lubricating capability, as a material for forming the lubricant layer.

As lubricants for thin-metal-film type magnetic recording medium, those having a fluorocarbon chain in the molecule are excellent in compatibility with thin metal films, and hence there have been proposed various fluorocarbon-based lubricants (for instance, Japanese Patent Application Kokai Nos. 61-107527, 61-107528, 61-107529, 62-92226, 62-92226 and 62-92227). In addition, compounds comprising a perfluroalkyl polyether chain have been proposed as lubricants for magnetic recording medium (for instance, U.S. Patent 3,778,308 and Japanese Patent Application Kokai No. 60-109028).

On the other hand, fluorine-containing compounds having the molecular structure shown below have been proposed as surfactants:

$$C_3F_7O \leftarrow CFCF_2O \xrightarrow{h} CFCONR_8COOH$$

wherein R₆ is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms, R₈ is an aliphatic alkylene group having 1, 2 or 5 carbon atoms, and h is zero or an integer of 1 to 8 (U.S. Patent 3,798,265).

The following is an important requirement which a lubricant for thin-metal-film type magnetic recording medium should satisfy. The lubricant should adhere strongly to the surface of the thin metal film or the protective film of the medium and the surface of a magnetic head to form a coating layer on each of the surfaces, and groups of molecules of the lubricant should easily be sheared from one another on the contact point of the coating layers, namely, on the surface on which the magnetic recording medium and the magnetic head slide.

Perfluoroalkyl polyethers heretofore well-known as lubricants for magnetic recording medium are good in the ease of shearing between groups of molecules because substantially the whole surface of each molecule is covered with fluorine atoms. But since the polarity of the molecules is low, the conventional lubricants have a low adhesive strength to the surface of a thin metal film or a protective film and the surface of a magnetic head. For removing this defect, there have been proposed perfluoroalkyl polyethers having various polar groups introduced into the ends of the molecule. But when their molecular weight is 3,000 or more, no sufficient effect of the introduction of the polar groups can be obtained. On the other hand, when the molecular weight is reduced for enhancing the effect of the polar groups, the interaction between molecules of the perfluoroalkyl polyether is weak, so that the amount of such a lubricant is decreased by its evaporation. Thus, the perfluoroalkyl polyethers and the terminally modified products thereof are poor in adhesive properties to the surface of a thin metal film or a protective film and the surface of a magnetic head, and in stability. Consequently, thin-metal-film type magnetic recording media obtained by using these compounds as lubricants have been poor in reliability on durability, in particular, in performance characteristics in low-humidity circumstances in which the aggregation of a magnetic metal

tends to occur on the surface of a magnetic head.

On the other hand, the fluorocarbon-based lubricants disclosed in the above prior art references have heretofore been used in thin-metal-film type magnetic recording media because of their excellent compatibility with thin metal films, but have been disadvantageous in that they cannot give a sufficient durability in a low-humidity circumstance of 10% RH or less.

Conventional processes for producing a fluorine-containing compound are described below.

A process for producing a fluorine-containing alkylsuccinic acid derivative has been proposed in Japanese Patent Application Kokai No. 61-257226. Specifically, in this process, the fluorine-containing alkylsuccinic acid derivative is obtained by subjecting a mixture of equimolar amounts of a higher alcohol having a perfluoroalkyl group and alkylsuccinic anhydride to reaction with heating at 60° to 150° C in the atmosphere. This process is effective against perfluoroalkyl group, but has been disadvantageous in that when an alcohol having a fluoroalkyl ether group is used in place of the higher alcohol having a perfluoroalkyl group, the yield of the fluorine-containing alkylsuccinic acid derivative is as very low as 10% or less because the reactivity of the former alcohol is considerably lower than that of the latter alcohol. Furthermore, this process has been disadvantageous also in that since the position of attachment of the fluoroalkyl ether end group to an aliphatic-alkylcarboxylic acid is limited to the carbon atom at the α or β position adjacent to the carboxyl group, there cannot be obtained a fluorine-containing compound in which the fluoroalkyl ether end group is attached to any of various positions from a position to ω position.

A process for producing a nitrogen-containing perfluoro(carboxylic acid fluoride) has been proposed in Japanese Patent Application Kokai No. 64-70450. Specifically, in this process, a perfluoro(3-dialkylamino-n-butyric fluoride) is obtained by electrolyzing a reactive derivative of 3-dialkylamino-n-butyric acid in liquid hydrogen fluoride. This process has been disadvantageous not only in that both of the two aliphatic hydrocarbon end groups in the molecule of the product are perfluoroalkyl groups, but also in that it is difficult to utilize an aliphatic long-chain alkyl group or an aliphatic polyalkyl oxide group.

A process for producing a phthalic acid diester having a perfluorobutenyloxy group has been proposed in Japanese Patent Application Kokai No. 61-24547. Specifically, in this invention, the phthalic acid diester having a perfluorobutenyloxy group is obtained by adding 2 to 20 moles of an aliphatic alcohol having an alkyl group having 1 to 15 carbon atoms and 0.01 to 1 mole of concentrated sulfuric acid per mole of a phthalic anhydride derivative having a perfluorobutenyloxy group, and carrying out the reaction with refluxing the alcohol or dt 100° to 150°C for 30 minutes to 24 hours. This process has been disadvantageous not only in that both reactive groups of the acid anhydride becomes ester linkage groups, but also in that a fluoroalkyl ether group cannot be utilized because a fluoroalkyl group as the end group is limited to perfluorobutenyloxy group.

A process for producing a perfluoroalkyl-substituted half ester or a perfluoroalkyl-substituted half amide has been proposed in Japanese Patent Application Kokai No. 54-84524. Specifically, in this process, the perfluoroalkyl-substituted half ester or half amide is obtained by reacting maleic anhydride with a hydroxy-substituted or amino-substituted nonionic compound (e.g. an aliphatic alkyl alcohol or an aliphatic alkyl amine) at room temperature or at 50° to 100° C to obtain a maleic acid half ester or a maleic acid half amide, and then adding a perfluoroalkylalkylene thiol to the thus obtained half ester or half amide at 30° to 75° C in the presence of a base catalyst. The perfluoroalkyl-substituted half ester or half amide can be obtained also by reversing the order of the above reactions. These processes have been disadvantageous in that the product obtained by them is a mixture of compounds having a thioether linkage group to the carbon atom at the α or β , respectively, position adjacent to the carboxyl group, so that there cannot be obtained a single fluorine-containing compound having a thioether linkage group only to the carbon atom at the α position.

SUMMARY OF THE INVENTION .

An object of the present invention is to provide a novel fluorine-containing compound which imparts a high reliability on durability to thin-metal-film type magnetic recording media in all circumstances including low-humidity circumstances; a lubricant composition comprising the fluorine-containing compound; and a magnetic recording medium such as a magnetic tape, a magnetic disc, etc., the lubricant layer of which comprises the fluorine-containing compound.

In order to achieve this object, the present inventors conducted various researches in consideration of the problems in the prior art and consequently have found that a fluorine-containing compound having in the molecule a fluoroalkyl ether end group, an aliphatic hydrocarbon end group and a specific polar end group is most suitable as a lubricant for thin-metal-film type magnetic recording medium. The present invention was made on the basis of such finding and a novel production process.

The present invention relates to fluorine-containing compounds represented by the general formula [I]:

$$R_{1} \leftarrow W)_{0}$$

$$Z - R_{4} - COOH$$

$$R_{f} \leftarrow X \rightarrow_{m} R_{2} \leftarrow Y \rightarrow_{n} R_{3}$$
[1]

- wherein R₁ is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R₁ is an aliphatic alkyl end group or an aliphatic alkenyl end group, R₂ is an aliphatic alkylene group or an aliphatic polyalkylene oxide group which have no or one or more carbon atoms, each of R₃ and R₄ is an aliphatic alkylene group having no or one or more carbon atoms, X is a connecting group selected from the group consisting of
- 15 -COOR5- and -CON(R6)-

5

20

25

30

40

45

(wherein R_5 is an aliphatic alkylene group having no or one or more carbon atoms, and R_6 is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), each of W and Y is a connecting group selected from the group consisting of

-S-, -COO- and -SCH2 CH(R7)COO-

(wherein R_7 is a hydrogen atom or a methyl group), Z is a connecting group selected from the group consisting of

and each of 1, m and n is zero or 1.

More specifically, the present invention relates to fluorine-containing compounds represented by the following general formulas [II], [III], and[VII] to [X]:

$$R_f \xrightarrow{R_1} CH(CH_2)_{1-n}COOH$$
 [II]

- wherein R_1 is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, R'_2 is an aliphatic alkylene group or an aliphatic polyalkylene oxide group, X is a connecting group selected from the group consisting of
- 50 -COOR5- and -CON(R6)-

(wherein R_5 is an aliphatic alkylene group having no or one or more carbon atoms, and R_6 is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), and each of m and n is zero or 1;

$$R_{f} \xrightarrow{R_{1}} CH - R_{4} - COOH$$
[III]

wherein R₁ is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R₁ is an aliphatic alkyl end group or an aliphatic alkenyl end group, each of R''₂ and R₄ is an aliphatic alkylene group having no or one or more carbon atoms, X' is a connecting group selected from the group consisting of

-COOR's- and -CON(R6)-

(wherein R'₅ is an aliphatic alkylene group, and R₆ is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), and m is zero or 1;

wherein R_f is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R₁ is an aliphatic alkyl end group or an aliphatic alkenyl end group, R'''₂ is an aliphatic alkylene group, and R₄ is an aliphatic alkylene group having no or one or more carbon atoms;

$$R_{f} \xrightarrow{R_{1}^{-OCO}} Z'-COOH$$
 [VIII]

wherein R_f is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, R'_2 is an aliphatic alkylene group or an aliphatic polyalkylene oxide group, X is a connecting group selected from the group consisting of

-COOR5- and -CON(R6)-

(wherein R_5 is an aliphatic alkylene group having no or one or more carbon atoms, and R_6 is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), Z' is a connecting group represented by the formula:

and m is zero or 1;

55

50

20

30

35

$$R'_{1}^{-S} \longrightarrow CH(CH_{2})_{1-n}COOH$$

$$R_{f} \leftarrow X \xrightarrow{m} R'_{2}^{-OCO(CH_{2})}_{n}$$
[IX]

wherein R_i is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R'₁ is an aliphatic alkyl end group, R'₂ is an aliphatic alkylene group or an aliphatic polyalkylene oxide group, X is a connecting group selected from the group consisting of

-COOR5- and -CON(R6)-

5

15

25

(wherein R₅ is an aliphatic alkylene group having no or one or more carbon atoms, and R₆ is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), and each of m and n is zero or 1;

wherein R_f is a floroalkyl ether end group having 5 to 50 carbon atoms, R'_1 is an aliphatic alkylene group or an aliphatic polyalkylene oxide group, R_7 is a hydrogen atom or a methyl group, X is a connecting group selected from the group consisting of

30 -COOR5- and -CON(R6)-

(wherein R₅ is an aliphatic alkylene group having no or one or more carbon atoms, and R₆ is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), and m is zero or 1.

5 DESCRIPTION OF THE PREFERRED EMBODIMENTS

The end groups of the fluorine-containing compounds of the present invention include, for example, the groups described below.

The aliphatic hydrocarbon end groups, i.e., the aliphatic alkyl end group and the aliphatic alkeryl end group, include, for example,

C_iH_{2i-1}-

$$\begin{smallmatrix} \mathbf{C_{i}^{H}_{2i+1}} - \mathbf{CH} - \mathbf{C_{k}^{H}_{2k}} \\ \mathbf{C_{j}^{H}_{2j+1}} \end{smallmatrix}$$

wherein each of i and j is an integer of 6 or more, and k is zero or an integer of 1 or more. The number of carbon atoms of each of these end groups is suitably 6 to 30 (preferably 10 to 26). When it is 5 or ess, or 31 or more, the lubricating properties are deteriorated.

50

The fluoroalkyl ether end group includes

5

10

15

20

25

30

$$F \leftarrow C_{3}F_{6}O \xrightarrow{p} C_{2}F_{4}-$$

$$CF_{3}O \leftarrow C_{2}F_{4}O \xrightarrow{p} \leftarrow CF_{2}O \xrightarrow{q} CF_{2}-$$

$$CF_{3} \xrightarrow{CF_{3}} \xrightarrow{CF_{3}}$$

$$F \leftarrow CFCF_{2}O \xrightarrow{p} CF-$$

$$CF_3$$
 $CF_3O \leftarrow CF_2CFO \xrightarrow{p} \leftarrow CF_2O \xrightarrow{q} CF_2$

$$CF_3$$
 $CC1F_2O \leftarrow CF_2CFO \rightarrow_p \leftarrow CF_2O \rightarrow_q CF_2$

wherein p is an integer of 1 to 15, and q is an integer of 1 to 45. The number of carbon atoms of each of these end groups is suitably 50 or less (preferably 40 or less). When it is 51 or more, the effect of the polar end group is lessened.

Processes for producing the fluorine-containing compounds of the present invention are explained below.

A fluorine-containing compound of the general formula [II] can be produced in high yield by subjecting a mixture of equimolar amounts of an aliphatic-alkylsuccinic anhydride or an aliphatic-alkenylsuccinic anhydride and an alcohol having an fluoroalkyl ether group to addition reaction with heating at 100° to 150°C, at a pressure of 3 kg/cm² or more in an autoclave. As to this addition reaction, a conventional method in which the reaction is carried out at atmospheric pressure gives a very low yield. In the present invention, a high yield can be obtained by finding out a method in which as described above, the reaction is carried out under pressure. In this case, a pressure of at least 3 kg/cm² is required.

A fluorine-containing compound of the general formula [III] can be obtained by adding a carboxylic acid halide having a fluoroalkyl ether group to a mixed solution of an aliphatic-alkyl oxy-acid or an aliphatic-alkenyl oxy-acid and a base such as triethylamine or pyridine (as a solvent, the base itself or an aprotic anhydrous solvent such as anhydrous benzene or anhydrous ether is suitable) slowly with ice-cooling so as to make the amount of the acid halide equimolar with that of the oxy-acid, subjecting the reactive group of the acid halide and the hydroxyl group of the oxy-acid to esterification, and capturing and removing secondarily produced hydrochloric acid by means of the base.

As to a method for attaching a fluoroalkyl ether group to the hydroxyl group of an oxy-acid, when esterification is carried out by the use of a carboxylic acid having a fluoroalkyl ether group and a conventional acid catalyst at a high temperature, the carboxyl group of the oxy-acid inhibits this reaction, so that the fluoroalkyl group cannot be attached to the hydroxyl group of the oxy-acid. Thus, the present inventors have found that this esterification can be allowed to proceed only by a method in which a carboxylic acid halide having a fluoroalkyl group is used and the reaction is carried out at a low temperature. This finding enabled the production of the fluorine-containing compound of the present invention.

A fluorine-containing compound of the general formula [VII] can be produced by adding an aqueous solution of an weak alkali such as sodium carbonate or potassium carbonate to a mixed solution of equimolar amounts of a secondary alkylamine having a fluoroalkyl ether group and a ω -haloalkylcarboxylic acid ester (as a solvent, a hydrophilic solvent such as acetone or methyl ethyl ketone is suitable), refluxing the resulting mixture with heating to induce dehalogenation and nitrogen-carbon bonding reaction, and then

subjecting the ester linkage group to hydrolysis with a strong alkali to make one of the end groups into a carboxyl group. In the dehalogenation, a carboxyl group inhibits the attack of the ω -haloalkyl group against the imino group because of its high affinity for the imino group. Thus, the present inventors have found that since the presence of a carboxyl group inhibits the dehalogenation, the nitrogen-carbon bonding reaction can be allowed to proceed by masking the carboxyl group, for example, by subjecting the carboxyl group to esterification. This finding also enabled the production of the fluorine-containing compound of the present invention.

A fluorine-containing compound of the general formula [VIII] can be produced by adding an alcohol having a fluoroalkyl ether group to a mixed solution of trimellitic anhydride chloride and a base such as triethylamine or pyridine (as a solvent, the base itself or an aprotic anhydrous solvent such as anhydrous benzene or anhydrous ether is suitable) slowly with ice-cooling so as to make the amount of the alcohol equimolar with that of trimellitic anhydride chloride, capturing and removing secondarily produced hydrochloric acid by means of the base to obtain a trimellitic anhydride fluoroalkyl ether ester, adding to the ester an alcohol having an aliphatic hydrocarbon group in an amount equimolar with the amount of the ester and an aprotic anhydrous solvent such as anhydrous benzene or anhydrous n-heptane, refluxing the resulting mixture with heating at 70° to 140°C to subject the reactive group of the acid anhydride to esteraddition reaction with the alcohol having an aliphatic hydrocarbon group. The esterification of the trimellitic anhydride chloride is carried out by subjecting the reactive group of acid anhydride to a second-stage reaction after subjecting the reactive group of acid chloride to a first-stage reaction. By these reaction, different alcohol moieties can be introduced into the same molecule through ester linkages. Moreover, one of the carbonyl groups, i.e., the reactive groups of acid anhydride becomes carboxyl end group. Thus, the present inventors have found that in the second-stage reaction, the alcohol attached through an ester linkage by the first-stage reaction does not undergo hydrolysis and transesterification. This finding also enabled the production of the fluorine-containing compound of the present invention.

A fluorine-containing compound of the general formula [IX] can be produced in high yield by subjecting a mixture of equimolar amounts of thiomalic anhydride having an aliphatic alkyl group and an alcohol having a fluoroalkyl ether group to addition reaction with heating at 100° to 150°C, at a pressure of 3 kg/cm² or more in an autoclave. As to this addition reaction, a conventional method in which the reaction is carried out at atmospheric pressure gives a very low yield. In the present invention, a high yield can be obtained by finding out a method in which, as described above, the reaction is carried out under pressure. In this case, a pressure of at least 3 kg/cm² is required.

A fluorine-containing compound of the general formula [X] can be produced by adding a base catalyst such as sodium acetate, triethylamine, or pyridine and a polymerization inhibitor such as hydroquinone to a mixed solution of equimolar amounts of an α -mercapto aliphatic-alkylcarboxylic acid and an acrylate or a methacrylate which have a fluoroalkyl ether group (as a solvent, a hydrophilic solvent such as ethanol or methyl ethyl ketone is suitable), and refluxing the resulting mixture with heating to add a group having a carbon-carbon double bond, i.e., an acryl or methacryl group to the mercapto group. The addition reaction of an aliphatic-alkylthiol to an aliphatic-alkylolefin has heretofore been well known [as literature on this reaction, there is, for example, "Yuki lo Kagaku-Gosei Hanno Hen (Organic sulfur Chemistry-Synthetic Reaction)" p. 33, Kagaku Dojin K.K., (1982)]. The present inventor have found that also when an α -mercapto aliphatic-alkylcarboxylic acid is used as a thiol, the above addition reaction proceeds without inhibition by the carboxyl group. This finding also enabled the production of the fluorine-containing compound of the present invention.

As the starting fluoroalkyl ethers used for producing the fluorine-containing compounds of the present invention, there are, for example, the compounds described below.

The alcohol having a fluoroalkyl ether group includes, for example,

50

$$F \leftarrow C_{3}F_{6}O \rightarrow_{p} C_{2}F_{4}CH_{2}OH$$

$$CF_{3}O \leftarrow C_{2}F_{4}O \rightarrow_{p} \leftarrow CF_{2}O \rightarrow_{q} CF_{2}CH_{2}OH$$

$$F \leftarrow CFCF_{2}O \rightarrow_{p} CFCH_{2}OH$$

$$CF_{3} \qquad CF_{3} \qquad CF_{3} \qquad CF_{3} \qquad CF_{3}OH$$

$$F \leftarrow CFCF_{2}O \rightarrow_{p} CFCH_{2}OCO(CH_{2})_{3}OH$$

$$CF_{3} \qquad CF_{3} \qquad CF_{3} \qquad CF_{4}OH$$

$$CF_{3} \qquad CF_{4}OH$$

wherein R₆ is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms, R'''₂ is an aliphatic alkylene group, p is an integer of 1 to 15, q is an integer of 1 to 45, and r is an integer of 1 or more.

The carboxylic acid halide having a fluoroalkyl ether group includes, for example,

 $\begin{array}{c} \text{CF}_3 \\ \mid \\ \text{CC1F}_2\text{O} & \leftarrow \text{CF}_2\text{CFO} & \rightarrow_{\overline{q}} \leftarrow \text{CF}_2\text{O} & \rightarrow_{\overline{q}} \leftarrow \text{CF}_2\text{CH}_2\text{OH} \end{array}$

$$F \leftarrow C_3 F_6 O \rightarrow_p C_2 F_4 COX$$

$$CF_3O \leftarrow C_2F_4O \xrightarrow{p} \leftarrow CF_2O \xrightarrow{q} CF_2COX$$

$$F \leftarrow CFCF_{2}O \rightarrow P CFCOX$$

$$F \leftarrow CFCF_2O \xrightarrow{p} CFCH_2OCO(CH_2)_2COX$$

$$F \leftarrow CFCF_2O \rightarrow P CFCH_2OCO(CH_2)_3COX$$

$$F \leftarrow CFCF_{2}O \xrightarrow{p} CFCONR" _{2}COX$$

$$CF_3$$
 CF_3
 CF_2
 COX

$$CC1F_2O \leftarrow CF_2CFO \xrightarrow{p} \leftarrow CF_2O \xrightarrow{q} CF_2COX$$

wherein R₆ is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms, R'''₂ is an aliphatic alkylene group, X is a fluorine atom or a chlorine atom, p is an integer of 1 to 15, and q is an integer of 1 to 45.

The secondary alkylamine having a fluoroalkyl ether group includes, for example,

$$F \leftarrow C_3F_6O \rightarrow C_2F_4CH_2NHR_1$$

$$CF_3O \leftarrow C_2F_4O \xrightarrow{p} \leftarrow CF_2O \xrightarrow{q} CF_2CH_2NHR_1$$

$$\begin{array}{ccc}
 & CF_3 & CF_3 \\
 & & | & | \\
 & F \leftarrow CFCF_2O \xrightarrow{p} CFCH_2NHR_1
\end{array}$$

$$CF_3O \leftarrow CF_2CFO \xrightarrow{p} \leftarrow CF_2O \xrightarrow{q} CF_2CH_2NHR_1$$

$$\begin{array}{c} \text{CF}_3 \\ \mid \\ \text{CC1F}_2\text{O} \xrightarrow{\text{CF}_2\text{CFO}} \xrightarrow{\text{p}} \left(\text{CF}_2\text{O} \xrightarrow{\text{q}} \text{CF}_2\text{CH}_2\text{NHR}_1 \right) \end{array}$$

wherein R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, p is an integer of 1 to 15, and q is an integer of 1 to 45.

The acrylate having a fluoroalkyl ether group includes, for example,

$$F \leftarrow C_3 F_6 O \rightarrow_p C_2 F_4 CH_2 OCOCH = CH_2$$

$$CF_3O \leftarrow C_2F_4O \rightarrow p \leftarrow CF_2O \rightarrow q CF_2CH_2OCOCH=CH_2$$

$$F \leftarrow CFCF_{2}O \xrightarrow{p} CFCH_{2}OCOCH = CH_{2}$$

$$F \leftarrow CFCF_{2}O \rightarrow CFCH_{2}OCO(CH_{2})_{3}OCOCH = CH_{2}$$

$$F \leftarrow CFCF_2O \rightarrow P CFCH_2OCO(CH_2)_4OCOCH=CH_2$$

$$F \leftarrow CFCF_2O \xrightarrow{CF_3} F_6$$
 $F \leftarrow CFCF_2O \xrightarrow{P} CFCONR" _2OCOCH=CH_2$

$$F \leftarrow CFCF_{2}O \rightarrow \frac{CF_{3}}{p}CFCO \leftarrow OC_{2}H_{4} \rightarrow \frac{CF_{2}}{r}OCOCH = CH_{2}$$

$$F \leftarrow CFCF_2O \rightarrow p CFCO \leftarrow OC_3H_6 \rightarrow r OCOCH=CH_2$$

$$CF_3$$
 CF_3
 CF_2
 CF_2

$$CC1F_2O \leftarrow CF_2CFO \xrightarrow{p} \leftarrow CF_2O \xrightarrow{q} CF_2CH_2OCOCH=CH_2$$

wherein R₆ is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms, R'''₂ is an aliphatic alkylene group, p is an integer of 1 to 15, q is an integer of 1 to 45, and r is an integer of 1 or more.

The methacrylate having a fluoroalkyl ether group includes, for example,

$$F \leftarrow C_3 F_6 O \rightarrow C_2 F_4 CH_2 O C C = CH_2$$

$$CF_{3} \leftarrow C_{2}F_{4}O \rightarrow_{p} \leftarrow CF_{2}O \rightarrow_{q} CF_{2}CH_{2}OCOC=CH_{2}$$

$$CF_{3} \qquad CF_{3} \qquad CH_{3} \qquad CH_{3}$$

wherein R₆ is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms, R'''₂ is an aliphatic alkylene group, p is an integer of 1 to 15, q is an integer of 1 to 45, and r is an integer of 1 or more.

As the lubricant compositions of the present invention, mixtures of a fluorine-containing compound of the general formula [I] and another lubricant are suitable. As the another lubricant, fluorocarbon type lubricants are preferably used. The fluorine-containing compound of the general formula [I] can be used alone as an lubricant. In particular, the fluorocarbon type lubricants described, for example, in Japanese Patent Application Kokai Nos. 61-107527, 61-107528, 61-107529, 62-92225, 62-92226 and 62-92227 are

suitable. In addition, other conventional lubricants, rust preventives, etc. can be used in admixture with the fluorine-containing compound of the general formula [I].

The fluorine-containing compound of the general formula [I] should be contained in the lubricant composition in a proportion of 20% or more, preferably 30% or more. When its content is less than 20%, the effect of the present invention can hardly be obtained.

Next, there are explained below examples of thin ferromagnetic-metal-film type magnetic recording medium obtained by forming a lubricant layer comprising the fluorine-containing compound of the general formula [I].

The above-mentioned lubricant composition is applied on the magnetic layer of a thin-ferromagnetic-metal-film type magnetic recording medium directly or with a protective layer between by a conventional wet coating method or a dry coating method such as vacuum deposition. As to the amount of coating, the composition is applied in the form of a thin layer in an amount of 0.05 to 100 mg, preferably 0.1 to 50 mg, per m² of the surface.

As the thin ferromagnetic metal film, there can be used thin films of Co, Co-Ni, Co-Cr, Co-Fe, Co-Ni-Cr, Co-Ni-Fe, Co-Ni-P, Co-Ni-Ta and the like, and a partially oxidized product thereof. These thin films are formed by vacuum deposition, sputtering, ion plating, plating, etc. If necessary, a primer layer of Cr, Ti or the like can be formed. The thickness of the thin ferromagnetic metal film including the thickness of the primer layer is suitably 500 to 5,000 Å. On the surface of the thin ferromagnetic metal film, there can optionally be formed, for example, a metallic protective layer of Cr, W, NiP or the like; an inorganic protective layer of SiO, SiC, carbon, graphite, diamond-like carbon or the like; an organic protective layer of a fluororesin, silicone resin, epoxy resin, polyamide resin, plasma polymerization product, radiation polymerization product or the like; or a composite protective layer.

As a non-magnetic substrate, there can be used those composed mainly of an oxide such as glass, ceramics or th like; a metal such as Al alloy, Ti alloy or the like; or a plastic such as polyester, polyimide, polyamide-imide, polycarbonate, polyacrylate or the like. In addition, there can be used substrates obtained by optionally forming a Co-P plated film, a polyimide coating film or the like on the surface of any of these materials, and substrates obtained by optionally forming, for example, protuberances in the form of fine particles, hills, waves or the like, or by texturing. The surface roughness of the substrates is suitably 50 to 600 Å in terms of maximum height (R max.). As their shape, for example, tape, film, sheet, disc, card and drum shapes can be chosen depending on purposes.

The fluorine-containing compounds of the present invention have in the molecule a fluoroalkyl ether end group, an aliphatic hydrocarbon end group and a specific polar end group, and their molecular weight is hundreds to about 3,000. Therefore, the effect of the polar end group is sufficiently brought about and the polar end group adheres strongly to the surface of the thin metal film or the protective film and the surface of a magnetic head. In addition, the fluoroalkyl ether end group is exposed at the surface of the lubricant layer to contribute to the reduction of the surface energy and make the surface not adhesive. Furthermore, the aliphatic hydrocarbon end group has a flexible carbon-carbon chain, and molecules of the compound are oriented by the moderate intermolecular interaction with the hydrocarbon chains of adjacent molecules, so that the compound has satisfactory lubricating properties.

Accordingly, by virtue of these synergistic effects of the end groups, a satisfactory lubricating capability is exhibited in all circumstances including low-humidity circumstances. Therefore, the problems in the reliability on durability of a thin-metal-film type magnetic recording medium are solved.

As described above, the fluorine-containing compounds of the present invention can be utilized not only singly but also in the form of a lubricant composition comprising a mixture of the fluorine-containing compound and a conventional compound. Moreover, they can be utilized for producing a magnetic recording medium comprising a lubricant layer comprising the fluorine-containing compound. Therefore, their industrial value is very high.

In Examples 1 to 49, there are specifically described examples of fluorine-containing compound and processes for producing the same. In Examples 50 to 112, there are specifically described examples of magnetic recording medium obtained by using a lubricant composition comprising each of the fluorine-containing compounds.

However, the present invention should not be construed to be restricted by these examples.

Example 1

Production of
$$\begin{array}{c} \text{CF}_3 & \text{CF}_3^{3} & \text{CHCH}_2\text{COOH} \\ \text{F} & \text{CFCF}_2\text{O} \rightarrow_3 & \text{CFCH}_2\text{OCO} \end{array} \end{array}$$
 and
$$\begin{array}{c} \text{CF}_3 & \text{CF}_3 & \text{CF}_3 \\ \text{F} & \text{CFCF}_2\text{O} \rightarrow_3 & \text{CFCH}_2\text{OCOCH}_2 \end{array}$$
 (molecular weight: 1,000)

In a 1-liter pressure autoclave made of glass having an agitating blade were placed 64.8 g (0.10 mole) of an alcohol having a fluoroalkyl ether group represented by the formula

$$F \leftarrow CF(CF_3)CF_2O \rightarrow \frac{1}{3}CF(CH_3)CH_2OH$$

and 35.3 g (0.10 mole) of octadecylsuccinic anhydride. The air in the system was replaced with nitrogen, after which the reaction was carried out with stirring at 120°C and at a nitrogen pressure of 3 kg/cm² for 5 hours. Then, the reaction mixture was dissolved in isopropyl ether, and the resulting solution was cooled to -10°C to remove the unreacted octadecylsuccinic anhydride. Subsequently, the residue was transferred to a vacuum distillation still provided with an oil diffusion pump and the unreacted alcohol having a fluoroalkyl ether group was removed under conditions of 100°C and about 1 x 10⁻³ mmHg to obtain 92 g (yield 92%) of a white solid having a melting point of 86°C. As a result of infrared spectroscopic analysis (IR), gel permeation chromatography (GPC) and field desorption mass spectrometry (FD-MS), the while solid was found to be a mixture of fluorine-containing compounds of the formulas A and A' which did not contain the starting materials and any by-product.

There appeared an absorption peak due to a carboxylic acid at 1,705 cm⁻¹ and an absorption peak due to an ester at 1,755 cm⁻¹. An absorption peak due to the acid anhydride at 1,775 cm⁻¹ disappeared.

There were not detected the starting materials, i.e., the alcohol having a fluoroalkyl ether group and octadecylsuccinic anhydride.

FD-MS; A parent peak appeared at a m/e ratio of 1,000.

In a 1-liter flask equipped with an agitating blade and a dropping funnel were placed 90.0 g (0.10 mole) of a secondary alkylamine having a fluoroalkyl ether group represented by the formula

$$F \leftarrow CF(CF_3)CF_2O \rightarrow 3 CF(CF_3)CH_2NHC_{18}H_{37}$$

21.4 g (0.10 mole) of methyl 3-iodopropionate and 300 ml of methyl ethyl ketone (MEK). A solution of 15.9 g of sodium carbonate in 100 ml of distilled water was added dropwise with stirring over a period of about 1 hour while raising the temperature. Then, refluxing and stirring were continued for another 8 hours to complete the reaction. After completion of the reaction, the MEK was removed from the reaction solution by distillation, and hexane was added to the residue to obtain a solution. This solution was repeatedly washed with distilled water until the pH of the aqueous layer became 7. The washed solution was dried over

anhydrous sodium sulfate. Next, the hexane was distilled off and the residue was dissolved in isopropyl ether (IEP). The resulting solution was cooled to 5°C to remove the unreacted secondary alkylamine having a fluoroalkyl ether group. Then, the IPE was distilled off and the residue was dissolved in methanol. The resulting solution was cooled to 0°C to remove the unreacted methyl 3-iodopropionate. In a 1-liter flask equipped with an agitating blade and a dropping funnel were placed 59.2 g (0.06 mole) of the thus obtained methyl ester of fluorine-containing compound of the formula J and a solution of 13.0 g of sodium hydroxide in 150 ml of 90% ethanol. Refluxing and stirring were continued for 3 hours, after which 6 N hydrochloric acid was added until the reaction solution became acidic, whereby a precipitate was formed. The precipitate was dissolved in chloroform and the resulting solution was repeatedly washed with distilled water until the pH of the aqueous layer became 7. The washed solution was dried over anhydrous sodium sulfate. Then, the chloroform was distilled off, after which hexane was added to the residue to obtain a solution of the reaction product in hexane, and recrystallization was carried out at room temperature to obtain 52 g of a white solid having a melting point of 110°C. As a result of IR, GPC and FD-MS, the white solid was found to be the fluorine-containing compound of the formula J which did not contain the starting materials and any by-product.

IR;

An absorption peak due to a carboxylic acid at 1,710 cm⁻¹ appeared.

GPC;

There were not detected the stating materials, i.e., the secondary alkylamine having a

fluoroalkyl ether group and methyl 3-iodopropionate.

FD-MS;

A parent peak appeared at a m/e ratio of 972.

Production of $C_8^{H_17^{CH=CHC}8^{H_16}} \longrightarrow N(CH_2)_{11}^{COOH}$ [L] $F \leftarrow C_3^{F_6O} \xrightarrow{p} C_2^{F_4CH_2}$ (average molecular weight: 2,930)

A wax-like semisolid was obtained by the same production process as in Example 16, except for a secondary alkylamine having a fluoroalkyl ether group represented by the formula

$$F \leftarrow C_3 F_6 O \rightarrow P C_2 F_4 CH_2 NHC_{18} H_{35}$$

wherein p is an integer of 1 to 15 (average molecular weight: 2,730) and methyl 12-bromododecan ate as starting materials. As a result of IR, GPC and FD-MS, the wax-like semisolid was found to be a fluorine-containing compound of the formula L which did not contain the starting materials and any by-product.

IR;

An absorption peak due to a carboxylic acid at 1710 cm⁻¹ appeared.

GPC;

There were not detected the starting materials, i.e., the secondary alkylamine having a fluoroalkyl ether group and methyl 12-bromododecanoate.

FD-MS; A main peak appeared at a m/e ratio of 2930.

Example 19

Production of $\begin{array}{c}
C_{10}^{H_{21}} \\
C_{10}^{H_{21}} \\
C_{10}^{H_{21}}
\end{array}$ $\begin{array}{c}
C_{10}^{H_{21}} \\
C_{10}^$

A wax-like semisolid was obtained by the same production process as in Example 16, except for using a secondary alkylamine having a fluoroalkyl ether group represented by the formula

$$CC1F_2O + CF_2CF(CF_3)O - \frac{1}{p} + CF_2O - \frac{1}{q} + CF_2CH_2NHC_{10}H_{21}$$

wherein each of p and q is an integer of 1 to 15 (average molecular weight: 1,420) and methyl 6iodohexanoate as starting materials. As a result of IR, GPC and FD-MS, the wax-like semisolid was found to be a fluorine-containing compound of the formula M which did not contain the starting materials and any byproduct.

IR;

An absorption peak due to a carboxylic acid at 1,710 cm⁻¹ appeared.

GPC;

There were not detected the starting materials, i.e., the secondary alkylamine having a

fluoroalkyl ether group and methyl 6-iodohexanoate.

FD-MS;

A parent peak appeared at a m/e ratio of 1,530.

Example 20

10

40

45

In a 1-liter flask equipped with an agitating blade and a dropping funnel were placed 21.2 g (0.10 mole) of trimellitic anhydride chloride and 300 ml of anhydrous pyridine, and cooled to 5°C or lower. Then, a solution of 64.8 g (0.10 mole) of an alcohol having a fluoroalkyl ether group represented by the formula

 $F \leftarrow CF(CF_3)CF_2O \rightarrow \frac{1}{3}CF(CF_3)CH_2OH$

in 300 ml of anhydrous diethyl ether was added dropwise with stirring over a period of about 3 hours to carry out the reaction. After completion of the reaction, the reaction solution was washed with 5% hydrochloric acid. Then, it was repeatedly washed with distilled water until the pH of the aqueous layer became 7. The solution thus washed was dried over anhydrous sodium sulfate. Subsequently, the diethyl ether was distilled off, after which the residue was transferred to a vacuum distillation still provided with an oil diffusion pump, and the unreacted starting alcohol having a fluoroalkyl ether group was removed under conditions of 100 °C and about 1 x 10⁻³ mmHg to obtain 72.0 g of trimellitic anhydride fluoroalkyl ether ester. In a 1-liter flask equipped with an agitating blade were placed 72.0 g (0.088 mole) of this product, 23.8 g (0.088 mole) of stearyl alcohol and 300 ml of anhydrous benzene, and refluxed with heating to carry

out the reaction. After completion of the reaction, the reaction solution was allowed to stand at temperature for 24 hours to recrystallize the reaction product. The reaction product was further recrystallized from acetone to obtain a white solid (67 g) having a melting point of 42°C. As a result of IR, GPC and FD-MS, the white solid was found to be a mixture of fluorine-containing compounds of the formulas N and N' which did not contain the starting materials and any by-product.

IR:

There appeared an absorption peak due to a carboxylic acid at 1,705 cm⁻¹ and an absorption peak due to an ester at 1,755 cm⁻¹. An absorption peak due to the acid halide at 1,755 cm⁻¹ disappeared.

GPC:

10

15

There were not detected the starting materials, i.e., the alcohol having fluoroalky ether group, stearyl alcohol, and chloride of trimellitic anhydride, and any by-product.

FD-MS;

A parent peak appeared at a m/e ratio of 1,093.

Example 21

Product of $CF_{3}O \leftarrow C_{2}F_{4}O \xrightarrow{p} \leftarrow CF_{2}O \xrightarrow{q} CF_{2}CH_{2}OCO \longrightarrow COOH$ and $CF_{3}O \leftarrow C_{2}F_{4}O \xrightarrow{p} \leftarrow CF_{2}O \xrightarrow{q} CF_{2}CH_{2}OCO \longrightarrow COOC_{18}H_{35}$ $CF_{3}O \leftarrow C_{2}F_{4}O \xrightarrow{p} \leftarrow CF_{2}O \xrightarrow{q} CF_{2}CH_{2}OCO \longrightarrow COOC_{18}H_{35}$ [O']

(average molecular weight: 1,200)

A wax-like semisolid was obtained by the same production process as in Example 20, except for using as starting materials an alcohol having a fluoroalkyl ether group represented by the formula

$$CF_3O \leftarrow C_2F_4O \xrightarrow{p} \leftarrow CF_2O \xrightarrow{q} CF_2CH_2OH$$

wherein each of p and q is an integer of 1 to 7 (average molecular weight: 760), oleyl alcohol, and trimellitic anhydride chloride. As a result of IR, GPC and FD-MS, the wax-like semisolid was found to be a mixture of fluorine-containing compounds of the formulas O and O' which did not contain the starting materials and any by-product.

IR:

45

50

55

There appeared an absorption peak due to a carboxylic acid at 1,705 cm⁻¹ and an absorption peak due to an ester at 1,755 cm⁻¹. An absorption peak due to the acid anhydride at 1,775 cm⁻¹ disappeared.

GPC;

There were not detected the starting materials, i.e., the alcohol having a fluoroalkyl ether group, oleyl alcohol, and chloride of trimellitic anhydride, and any by-product.

FD-MS;

A parent peak appeared at a m/e ratio of 1,200.

Example 22

A wax-like semisolid was obtained by the same production process as in Example 20, except for using as starting materials an alcohol having a fluoroalkyl ether group represented by the formula

$$F = CF(CF_3)CF_2O = \frac{1}{D}CF(CF_3)CH_2OCO(CH_2)_3OH$$

wherein p is an integer of 1 to 15 (average molecular weight: 1,390), stearyl alcohol, and trimellitic anhydride chloride. As a result of IR, GPC and FD-MS, the wax-like semisolid was found to be a mixture of fluorine-containing compounds of the formulas P and P' which did not contain the starting materials and any by-product.

There appeared an absorption peak due to a carboxylic acid at 1,705 cm⁻¹ and an absorption peak due to an ester at 1,755 cm⁻¹. An absorption peak due to the acid anhydride at 1,775 cm⁻¹ disappeared.

GPC; There were not detected the starting materials, i.e., the alcohol having a fluoroalkyl ether group, stearyl alcohol, and chloride of trimellitic anhydride, and any by-product.

Example 23

45

40

25

30

A wax-like semisolid was obtained by the same production process as in Example 20, except for using as starting materials an alcohol having a fluoroalkyl ether group represented by the formula

$F \leftarrow CF(CF_3)CF_2O \rightarrow DCF(CF_3)CO \leftarrow OC_2H_4)_4OH$

- wherein p is an integer of 1 to 15 (average molecular weight: 1,330), stearyl alcohol, and trimellitic anhydride chloride. As a result of IR, GPC and FD-MS, the wax-like semisolid was found to be a mixture of fluorine-containing compounds of the formulas Q and Q' which did not contain the starting materials and any by-product.
- IR; There appeared an absorption peak due to a carboxylic acid at 1,705 cm⁻¹ and an absorption peak due to an ester at 1,755 cm⁻⁻¹. An absorption peak due to the acid anhydride at 1,775 cm⁻¹ disappeared.
 - GPC; There were not detected the starting materials, i.e., the alcohol having a fluoroalkyl ether group, stearyl alcohol, and chloride of trimellitic anhydride, and any by-product.

\end{array}$ Characteristic Characterist

In a 1-liter pressure autoclave made of glass having an agitating blade were placed 81.4 g (0.10 mole) of an alcohol having a fluoroalkyl ether group represented by the formula

$F - CF(CF_3)CF_2O - \frac{1}{4}CF(CF_3)CH_2OH$

and 38.5 g (0.10 mole) of octadecylthiomalic anhydride. The air in the system was replaced with nitrogen, after which the reaction was carried out with stirring for 10 hours at 120 °C and at a nitrogen pressure of 4 to 5 kg/cm². After completion of the reaction, the reaction mixture was dissolved in isopropyl ether and the resulting solution was cooled to -10 °C to remove the unreacted octadecylthiomalic anhydride Then, the residue was transferred to a vacuum distillation still produced with an oil diffusion pump, and the unreacted alcohol having a fluoroalkyl ether group was removed under conditions of 110 °C and about 1 x 10⁻³ mmHg to obtain 102 g (yield 85%) of a white solid. As a result of IR, GPC and FD-MS, the white solid was found to be a mixture of fluorine-containing compounds of the formulas R and R' which did not contain the starting materials and any by-product.

IR;

15

20

There appeared an absorption peak due to a carboxylic acid at 1,705 cm⁻¹ and an absorption peak due to an ester at 1,755 cm⁻¹. An absorption peak due to the acid anhydride at 1,775 cm⁻¹ disappeared.

GPC;

There were not detected the starting materials, i.e., the alcohol having a fluoroalkyl ether group and octadecylthiomalic anhydride.

FD-MS;

A parent peak appeared at a m/e ratio of 1,199.

Example 32

In a 1-liter pressure autoclave made of glass having an agitating blade were placed 138 g (0.10 mole) of an alcohol having a fluoroalkyl ether group represented by the formula

$$F - CF(CF_3)CF_2O - \frac{1}{p}CF(CF_3)CON(CH_3)C_2H_4OH$$

wherein p is an integer of 1 to 15 (average molecular weight: 1,380) and 27.2 g (0.10 mole) of decylthiomalic anhydride. The air in the system was replaced with nitrogen, after which the reaction was

carried out with stirring for 5 hours at 140°C and at a nitrogen pressure of 9 to 10 kg/cm2. After completion of the reaction, the same purifying treatment as in Example 31 was carried out to obtain 129 g (yield 78%) of a milk-white colloidal liquid. As a result of IR, GPC and FD-MS, the milk-white colloidal liquid was found to be a mixture of fluorine-containing compounds of the formulas S and S' which did not contain the starting materials and any by-product.

IR:

There appeared an absorption peak due to a carboxylic acid at 1,705 cm-1 and an absorption peak due to an ester at 1,755 cm⁻¹. An absorption peak due to the acid halide at 1,775 cm⁻¹ disappeared.

GPC;

There were not detected the starting materials i.e., the alcohol having a fluoroalkyl ether

group and decylthiomalic anhydride.

FD-MS;

A parent peak appeared at a m/e ratio of 1,650.

There was obtained 142 g of a wax-like semisolid by the same production process as in Example 38, except for using 133 g (0.10 mole) of an acrylate having a fluoroalkyl ether group represented by the formula 35

$$CC1F_2O - CF_2CF(CF_3)O - CF_2O - CF_2O - CF_2CH_2OCOCH = CH_2$$

wherein each of p and q is an integer of 1 to 15 (average molecular weight: 1,330) and 31.7 g (0.10 mole) of α-mercaptostearic acid as starting materials. As a result of IR, GPC and FD-MS, the wax-like semisolid was found to be a fluorine-containing compound of the formula Y which did not contain the starting materials and

IR;

any by-product.

40

45

50

55

There appeared an absorption peak due to a carboxylic acid at 1,705 cm⁻¹ and an absorption peak due to an ester at 1,755 cm⁻¹. There disappeared an absorption peak due to the thiol at 2,600 cm⁻¹ and an absorption peak due to a carbon-carbon double bond at 1,640 cm⁻¹.

GPC:

There were not detected the starting materials, i.e., the acrylate having a fluoroalkyl ether group and a-mercaptostearic acid.

FD-MS:

A parent peak appeared at a m/e ratio of 1,650.

Example 42

The following fluorine-containing compound was produced under the same conditions as in Example 38.

(average molecular weight: 1,670)

Examples 50 to 110

There was used a non-magnetic substrate composed of a polyester film and steep hill-shaped protuberances formed on the surface of the film in a number of 1 x 10⁷ per mm²: in the polyester film, granular protuberances with a gentle slope (average height 70 Å, diameter 1 µm) formed by silica particles contained in the polyester film were present in a number of several protuberances per 100 µm² of the film surface, and relatively large protruberances formed by fine particles attributable to the residue of a polymerization catalyst had been reduced as such as possible; and the hill-shaped protuberances had been formed by using silica colloidal particles having a diameter of 150 Å as cores and a ultraviolet-curable epoxy resin as a binder. A thin Co-Ni ferromagnetic metal film (Ni content 20%, film thickness 1000 Å) was formed on the substrate in the presence of a slight amount of oxygen by a continuous vacuum oblique deposition method. The oxygen content of the thin film was 5% in terms of atomic fraction.

Each of the above-mentioned fluorine-containing compounds of the present invention or a mixture of the compound and a conventional lubricant was applied on the thin metal film in an amount of 10 mg per m² of the surface of the thin metal film to form a lubricant layer. Then, the substrate thus treated was cut predetermined width to form a magnetic tape. Each of the magnetic tapes thus obtained was set in a commercially available video deck and its output characteristics during repeated running were measured in circumstances of 23°C and 5% RH. In detail, there was counted the number of runnings which could be conducted until the RF output became lower than its initial value by 3 dB or the output began to vary 1 shows the results obtained. The fluorine-containing compounds of the present invention used are denoted in Table 1 by the above example numbers. Table 1 also shows the measurement results obtained in the case of forming a lubricant layer by the use of a mixture of the fluorine-containing compound of the present invention and a conventional lubricant.

From Table 1, it can be seen that all of the magnetic tape samples having a lubricant layer comprising the fluorine-containing compound of the present invention are excellent in durability in repeated running at a low humidity. On the other hand, as shown for Comparative Examples 1 to 5, the magnetic tape samples having a lubricant layer comprising a conventional lubricant alone are poor in durability at a low humidity.

Examples 111 to 171

A plated non-magnetic Ni-P alloy film of 25 µm in thickness was formed on the surface of an Al alloy plate having a diameter of 95 mm and a thickness of 1.2 mm, and protuberances were formed in the surface of the film by texturing so as to adjust the average roughness of the surface to 50 Å and the maximum height of the protuberances to 300 Å, whereby a non-magnetic substrate was obtained. A Cr

primer layer of 1,300 Å in thickness and a thin Co-Ni ferromagnetic metal film of 600 Å in thickness were formed on the substrate by sputtering. A graphite protective layer of 200 Å in thickness was further formed on the thin metal film by sputtering. Thus, sample A was obtained. Sample B was obtained in the same manner as above except for forming a diamond-like carbon protective layer of 50 Å in thickness by plasma CVD in place of the graphite protective layer. Each of the above-mentioned fluorine-containing compounds of the present invention or a mixture of the compound and a conventional lubricant was applied on the protective layer of each of these samples in an amount of 10 mg per m² of the surface of the protective layer to form a lubricant layer. The magnetic discs thus obtained were subjected to a CSS endurance test in circumstances of 23 °C and 5% RH, and the durability was judged by the number of times of CSS at the time when the coefficient of friction exceeded 1.0 or when head crush occurred. Table 2 shows the results obtained. The fluorine-containing compounds of the present invention used are denoted in Table 2 by the above example numbers. Table 2 also shows the test results obtained in the case of forming a lubricant layer by the use of a mixture of the fluorine-containing compound of the present invention and a conventional lubricant.

From Table 2, it can be seen that all of the magnetic disc samples having a lubricant layer comprising the fluorine-containing compound of the present invention are excellent in CSS durability at a low humidity. On the other hand, as shown for Comparative Examples 6 to 10, magnetic disc samples having a lubricant layer comprising a conventional lubricant alone are poor in durability at a low humidity.

5 Claims

1. A fluorine-containing compound represented by the general formula [I]:

$$R_{1} \leftarrow W)_{0} > Z-R_{4}-COOH$$

$$R_{f} \leftarrow X \rightarrow_{m} R_{2} \leftarrow Y \rightarrow_{n} R_{3}$$
[I]

wherein R_1 is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, R_2 is an aliphatic alkylene group or an aliphatic polyalkylene oxide group which have no or one or more carbon atoms, each of R_3 and R_4 is an aliphatic alkylene group having no or one or more carbon atoms, X is a connecting group selected from the group consisting of

-COORs- and -CON(R6)-

5

10

15

20

25

30

35

40

45

50

(wherein R_5 is an aliphatic alkylene group having no or one or more carbon atoms, R_6 is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), each of W and Y is a connecting group selected from the group consisting of

-S-,-COO- and -SCH2CH(R7)COO-

(wherein R_7 is a hydrogen atom or a methyl group), Z is a connecting group selected from the group consisting of

and each of 1, m and n is zero or 1.

2. A process for producing a fluorine-containing compound represented by the general formula [II]:

$$R_1 \longrightarrow CH(CH_2)_{1-n}COOH$$

$$R_f \leftarrow X \rightarrow_m R'_2 -OCO(CH_2)_n$$
[11]

(wherein R_1 is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, R'_2 is an aliphatic alkylene group or an aliphatic polyalkylene oxide group, X is a connecting group selected from the group consisting of

-COORs - and -CON(R6)-

(wherein R_5 is an aliphatic alkylene group having no or one or more carbon atoms, and R_6 is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), and each of m and n is zero or 1) which comprises subjecting an aliphatic-alkylsuccinic anhydride or an aliphatic-alkenylsuccinic anhydride and an alcohol having a fluoroalkyl ether group having 5 to 50 carbon atoms to addition reaction in an autoclave.

55 3. A process for producing a fluorine-containing compound represented by the general formula [III]

$$R_f \leftarrow X' \rightarrow_m R''_2 - COO$$
 [III]

(wherein R_1 is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, each of R''_2 and R_4 is an aliphatic alkylene group having no or one or more carbon atoms, X' is a connecting group selected from the group consisting of

-COOR's- and -CON(R6)-

10

15

20

25

30

35

40

45

50

55

(wherein R_5 is an aliphatic alkylene group, and R_6 is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), and m is zero or 1) which comprises reacting an aliphatic-alkyl oxy-acid or an aliphatic-alkenyl oxy-acid with a carboxylic acid halide having a fluoroalkyl ether group having 5 to 50 carbon atoms in the presence of a base at a low temperature.

4. A process for producing a fluorine-containing compound represented by the general formula [VII]:

$$\begin{array}{c|c}
 & R_1 \\
 & N-R_4-COOH
\end{array} \qquad [VII]$$

(wherein R_1 is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, R'''_2 is an aliphatic alkylene group, and R_4 is an aliphatic alkylene group having no or one or more carbon atoms) which comprises reacting a secondary alkylamine having a fluoroalkyl ether group represented by the general formula [IV]:

$$\begin{array}{c}
R_1 \\
R_f - R''' \\
\end{array}$$
NH [IV]

(wherein R_1 is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, and R'''_2 is an aliphatic alkylene group) with ω -haloalkylcarboxylic acid ester represented by the general formula [V]:

QCH₂-R₄-COOR [V]

(wherein R is an aliphatic alkyl end group or an aliphatic alkenyl end group, R₄ is an aliphatic alkylene group having no or one or more carbon atoms, and Q is a halogen atom) in the presence of a weak alkali to synthesize a fluorine-containing compound represented by the general formula [VI]:

$$\begin{array}{c}
R_1 \\
N-R_4-COOR
\end{array} [VI]$$

(wherein R_f is a fluoroalkyl ether end group having 5 to 50 carbon atoms, each of R and R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, R'''_2 is an aliphatic alkylene group having no or one or more carbon atoms), and then subjecting an ester linkage group to hydrolysis with a strong alkali to make the end group on one side into a carboxyl group.

5. A process for producing a fluorine-containing compound represented by the general formula [VIII]:

$$R_1^{-OCO} > z' - COOH$$
 [VIII]

15

5

10

(wherein R_1 is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, R'_2 is an aliphatic alkylene group or an aliphatic polyalkylene oxide group, X is a connecting group selected from the group consisting of

20

(wherein R_5 is an aliphatic alkylene group having no or one or more carbon atoms, and R_6 is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), Z' is connecting group represented by the formula

30

25

$$\rightarrow$$

35

40

45

50

55

and m is zero or 1) which comprises reacting an aliphatic alkyl alcohol or an aliphatic alkenyl alcohol and an alcohol having a fluoroalkyl ether group having 5 to 50 carbon atoms stepwise and separately with trimellitic anhydride chloride.

6. A process for producing a fluorine-containing compound represented by the general formula [IX]:

$$R'_{1}^{-S} \xrightarrow{CH(CH_{2})_{1-n}COOH} [IX]$$

$$R_{f} \leftarrow X \xrightarrow{m} R'_{2}^{-OCO(CH_{2})_{n}}$$

(wherein $R_{\rm f}$ is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R'_1 is an aliphatic alkylene group, R'_2 is an aliphatic alkylene group or an aliphatic polyalkylene oxide group, X is a connecting group selected from the group consisting of

-COORs - and -CON(R6)-

(wherein R_5 is an aliphatic alkylene group having no or one or more carbon atoms, and R_6 is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), and each of m and n is zero or 1) which comprises subjecting thiomalic anhydride having an aliphatic alkyl group and an alcohol having a fluoroalkyl ether group having 5 to 50 carbon atoms to addition reaction in an autoclave.

7. A process for producing a fluorine-containing compound represented by the general formula [X]:

$$R_{f} \leftarrow X \rightarrow_{m} R'_{2} - OCOCHCH_{2} - S$$

$$R_{f} \leftarrow X \rightarrow_{m} R'_{2} - OCOCHCH_{2} - S$$

$$R_{f} \leftarrow X \rightarrow_{m} R'_{2} - OCOCHCH_{2} - S$$

(wherein R_1 is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R'_1 is an aliphatic alkyl end group, R'_2 is an aliphatic alkylene group or an aliphatic polyalkylene oxide group, R_7 is a hydrogen atom or a methyl group, X is a connecting group selected from the group consisting of

-COOR5- and -CON(R6)-

(wherein R_5 is an aliphatic alkylene group having no or one or more carbon atoms, and R_6 is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), and m is zero or 1) which comprises subjecting an α -mercapto-aliphatic-alkylcarboxylic acid and an acrylate or methacrylate having a fluoroalkyl ether group having 5 to 50 carbon atoms to addition reaction.

- 8. A lubricant composition comprising a fluorine-containing compound according to claim 1.
- 9. A magnetic recording medium comprising a non-magnetic substrate and a thin ferromagnetic metal film formed thereon, wherein a lubricant layer comprising at least one fluorine-containing compound according to claim 1 is formed on the thin ferromagnetic metal film directly or with a protective film between.

54) Fluorine-containing compounds.

(a) A fluorine-containing compound represented by the general formula [I]:

$$R_{1} \leftarrow W)_{\varrho} > z - R_{4} - COOH$$

$$R_{f} \leftarrow X \rightarrow_{m} R_{2} \leftarrow Y \rightarrow_{n} R_{3}$$
[1]

wherein R_1 is a fluoroalkyl ether end group having 5 to 50 carbon atoms, R_1 is an aliphatic alkyl end group or an aliphatic alkenyl end group, R_2 is an aliphatic alkylene group or an aliphatic polyalkylene oxide group which have no or one or more carbon atoms, each of R_3 and R_4 is an aliphatic alkylene group having no or one or more carbon atoms, X is a connecting group selected from the group consisting of

-COOR5- and -CON(R6)-

(wherein R_5 is an aliphatic alkylene group having no or one or more carbon atoms, and R_6 is a hydrogen atom or an aliphatic alkyl group having 1 to 12 carbon atoms), each of W and Y is connecting group selected from the group consisting of

-S-, -COO- and -SCH2CH(R7)COO-

(wherein R_7 is a hydrogen atom or a methyl group), Z is a connecting group selected from the group consisting of

and each of £, m and n is zero or 1. There are disclosed a fluorine-containing compound of a specific structure which has in the molecule a fluoroalkyl ether end group, an aliphatic hydrocarbon end group and a carboxyl end group, and has a molecular weight of hundreds to about 3,000; and a process for producing the fluorine-containing compound. This fluorine-containing compound can be utilized in magnetic recording media in the form of a lubricant composition.
